

Amendment to the claims

Please amend the claims as shown below in the listing of the claims.

1. (Original) A CO<sub>2</sub> sensor comprising a pH indicator and a long-lived reference luminophore, the reference luminophore either being doped in sol-gel particles and co-immobilised with the pH indicator in a porous sol-gel matrix, or being immobilised in a separate oxygen impermeable layer and the pH indicator in a sol-gel matrix being laid over the impermeable layer.
2. (Original) A CO<sub>2</sub> sensor as claimed in claim 1 wherein the pH indicator is selected from the group consisting of pH indicators including hydroxypyrene trisulphonate (HPTS), fluorescein, rhodamine B and other fluorescent pH indicators.
3. (Currently amended) A CO<sub>2</sub> sensor as claimed in claim 1 ~~or 2~~ wherein the long-lived reference luminophore is selected from the group consisting of a luminescent complex, in particular [Ru<sup>II</sup>-tris (4, 7-diphenyl-1,10-phenanthroline)]Cl<sub>2</sub>, ruthenium-based compounds with  $\alpha$ -diimine ligands, luminescent transition metal complexes with platinum metals Ru, Os, Pt, Ir, Re or Rh as the central metal atom and with  $\alpha$ -diimine ligands, and phosphorescent porphyrins with Pt or Pd as the central metal atom or luminescent doped crystals such as manganese-activated magnesium fluorogermanate, ruby, alexandrite and Nd-Yag.
4. (Currently amended) A CO<sub>2</sub> sensor as claimed in ~~any preceding~~ claim 1 wherein the porous sol-gel matrix is selected from the group consisting of a methyltriethoxysilane (MTEOS) sol- gel matrix, hybrid (organic-inorganic) sol-gel matrices including ethyltriethoxysilane (ETEOS), phenyltriethoxysilane (PhTEOS), n-octyl TEOS and methyltrimethoxysilane (MTMS), and UV-curable sol-gels, soluble ormosils, or hybrid polymer matrices.
5. (Currently amended) A CO<sub>2</sub> sensor as claimed in ~~any preceding~~ claim 1 wherein the luminophore is a ruthenium-doped sol-gel particle, in particular [Ru<sup>II</sup>-tris (4,7-diphenyl-1,10- phenanthroline)]Cl<sub>2</sub> -doped particles.

6. (Currently amended) A CO<sub>2</sub> sensor as claimed in ~~any preceding~~ claim 1 wherein the pH indicator and the long-lived reference luminophore are co-immobilised in a sol-gel matrix.
7. (Previously presented) A combined O<sub>2</sub>/CO<sub>2</sub> sensor comprising:-
  - (a) an O<sub>2</sub> sensor comprising an oxygen sensitive luminescent complex immobilised in a porous sol-gel matrix, and
  - (b) an CO<sub>2</sub> sensor comprising a pH indicator and a long-lived reference luminophore, the reference luminophore either being doped in sol-gel particles and co-immobilised with the pH indicator in a porous sol-gel matrix, or being immobilised in a separate oxygen impermeable layer and the pH indicator in a sol-gel matrix being laid over the impermeable layer, the sensor being interrogatable by an optical reader wherein the phase difference of a reference and an excitation phase signal is measured.
8. (Original) A combined O<sub>2</sub>/CO<sub>2</sub> sensor wherein the pH indicator and the long-lived reference luminophore are co-immobilised in a porous sol-gel matrix.
9. (Original) A combined O<sub>2</sub>/CO<sub>2</sub> sensor as claimed in claim 8 wherein the ruthenium-complex is selected from the group consisting of an oxygen sensitive luminescent complex such as ruthenium-based compounds with  $\alpha$ -diimine ligands and luminescent transition metal complexes with platinum metals (Ru, Os, Pt, Ir, Re or Rh) as the central metal atom and with  $\alpha$ -diimine ligands, and phosphorescent porphyrins with Pt or Pd as the central metal atom or luminescent doped crystals such as manganese-activated magnesium fluorogermanate, ruby, alexandrite and Nd-Yag.
10. (Currently amended) A combined O<sub>2</sub>/CO<sub>2</sub> sensor as claimed in claim 8 ~~or claim 9~~ wherein the immobilised O<sub>2</sub> sensor and the immobilised CO<sub>2</sub> sensor are coated onto the same substrate.
11. (Currently amended) A combined O<sub>2</sub>/CO<sub>2</sub> sensor as claimed in claim 8 ~~to 10~~ wherein the two sensors are coated onto the substrate side-by-side.
12. (Currently amended) A combined O<sub>2</sub>/CO<sub>2</sub> sensor as claimed in ~~any of~~ claims 5 to 8 wherein the substrate is selected from the group consisting of plastics materials

including surface- enhanced PET, PE and PET/PE laminates, adhesive plastic labels, rigid substrate materials including glass, Perspex/PMMA, polymer materials from which DVDs are made for example polycarbonate and other polymer materials, metal, and flexible substrate materials including acetate or flexible polymer materials, paper, optical fibre or glass/plastic capillary tubes.

13. (Currently amended) A method of making a CO<sub>2</sub> sensor comprising :-

(1) synthesis of an Ru(dpp)<sub>3</sub>(TSPS)<sub>2</sub> ion-pair comprising mixing dissolved Ru(dpp)<sub>3</sub>Cl<sub>2</sub> with trimethylsilylpropane sulfonic acid, sodium salt and allowing the ion-pair to precipitate; <sub>1</sub>

(2) synthesis of the particles comprising condensing the dissolved Ru(dpp)<sub>3</sub>(TSPS)<sub>2</sub> ion-pair with TEOS and halting the condensation reaction with alcohol, washing the condensate with alcohol and drying the condensate; <sub>1</sub> and

(3) ~~and~~ fabrication of the CO<sub>2</sub> sensor films comprising suspending the doped reference particles in the coimmobilisation matrix solution, mixing the coimmobilisation matrix solution into a pH indicator solution which comprises a pH indicator in a quaternary ammonium hydroxide solution, and saturating the mixture immediately with CO<sub>2</sub> followed by deposition onto a substrate.

14. (Previously presented) A method of making a CO<sub>2</sub> sensor in a dual-layer configuration wherein a low oxygen-sensitivity ruthenium complex is sealed in an oxygen impermeable layer and over-coated with the HPTS-based CO<sub>2</sub> sensing layer.

15. (Previously presented) A method as claimed in claim 13 wherein the quaternary ammonium hydroxide is selected from the group consisting of cetyl-trimethyl ammonium hydroxide (CTA-OH), tetra-octyl ammonium hydroxide (TOA-OH) or tetra-butyl ammonium hydroxide (TBA-OH) or other quaternary ammonium hydroxides.

16. (Currently amended) A method as claimed in claim 13 ~~or 15~~ wherein the pH indicator is selected from the group consisting pH indicators including hydroxypyrene trisulphonate (HPTS), fluorescein, rhodamine B and other fluorescent pH indicators.

17. (Currently amended) A packaging medium having a combined CO<sub>2</sub> sensor and an O<sub>2</sub> sensor as claimed in ~~any of claims 8 to 12~~ formed on a surface of the medium which will lie internally of the package when the package is formed.
18. (Previously presented) A packaging medium as claimed in claim 17 wherein the sensors are formed on the packaging medium by a method selected from the group consisting of dip-coating, spin-coating, spray-coating, stamp-printing, screen-printing, ink-jet printing, pin printing, lithographic or flexographic printing or gravure printing.
19. (Currently amended) A quality control method comprising reading a combined O<sub>2</sub>/CO<sub>2</sub> sensor as claimed in ~~any of claims 8 to 12~~, formed on the internal surface of a package, with an optical reader, and determining the levels of O<sub>2</sub> and CO<sub>2</sub> inside the package in relation to a control.
20. (Currently amended) A method of screen-printing a combined O<sub>2</sub>/CO<sub>2</sub> sensor as claimed in ~~any of claims 8 to 12~~ onto a substrate comprising forcing the sensor sol through a mask or mesh and drying the substrate.
21. (Currently amended) A method of ink-jet printing a combined O<sub>2</sub>/CO<sub>2</sub> sensor as claimed in ~~any of claims 5 to 9~~ onto a substrate comprising filling an ink reservoir of an ink-jet printer with sensor sol and printing the sensor sol onto the substrate using an ink-jet printer.
22. (Previously presented) A method of forming a gas-sensitive sensor on a substrate comprising printing the substrate with a porous sol-gel matrix comprising a gas sensitive indicator.
23. (Previously presented) A method as claimed in claim 22 wherein the gas sensitive indicator is an oxygen-sensitive luminescent complex.
24. (Previously presented) A method as claimed in claim 22 wherein the gas sensitive indicator is a pH indicator and a long-lived reference luminophore.
25. (Previously presented) A method as claimed in claim 22 wherein the gas sensitive indicator is a pH indicator and the substrate is further provided with separate oxygen impermeable layer comprising a long-lived reference luminophore.

26. (Currently amended) A method as claimed in ~~any of claims 22 to 24~~ wherein two gas sensors are formed on the substrate.
27. (Currently amended) A method as claimed in ~~any of claims 22 to 26~~ wherein the sensor is formed on the substrate by a method selected from the group consisting of dip-coating, spin-coating, spray-coating, stamp-printing, screen-printing, ink-jet printing, pin printing, lithographic or flexographic printing or gravure printing.
28. (Currently amended) A method as claimed in ~~any of claims 22 to 27~~ wherein the substrate is selected from the group consisting of plastics materials including surface-enhanced PET, PE and PET/PE laminates, adhesive plastic labels, rigid substrate materials including glass, Perspex/PMMA, polymer materials from which DVDs are made for example polycarbonate and other polymer materials, metal, and flexible substrate materials including acetate or flexible polymer materials, paper, optical fibre or glass/plastic capillary tubes.
29. (Currently amended) A method as claimed in ~~any of claims 22 to 28~~ wherein the sensor is a luminophore-based sensor.
30. (Currently amended) A method as claimed in ~~any of claims 22 to 28~~ wherein the sensor is a colorimetric-based sensor.
31. (Previously presented) A substrate having a gas-sensitive sensor formed thereon wherein the sensor comprises a sol-gel matrix comprising a gas sensitive indicator and the sensor has been formed by printing.
32. (Previously presented) A substrate as claimed in claim 31 wherein the substrate is selected from the group consisting of plastics materials including surface-enhanced PET, PE and PET/PE laminates, adhesive plastic labels, rigid substrate materials including glass, Perspex/PMMA, polymer materials from which DVDs are made for example polycarbonate and other polymer materials, metal, and flexible substrate materials including acetate or flexible polymer materials, paper, optical fibre or glass/plastic cap.
